

Subject: Technical Assessment – Software Engineer

Scenario

We pull trade data from the BSE Exchange API. A full pull takes up to 15 minutes, and our network kills any HTTP connection held open longer than 30 seconds.

What to Build

1. Mock BSE API

- Create GET /getTrades — returns seeded trade data (a few thousand records: trade ID, client, symbol, quantity, price, timestamp)
- Configurable delay to pull — 15 minutes;

2. Trades Dashboard

- Create a Dashboard that will consume /getTrades.

Dashboard opens instantly, showing trades already pulled — even while a pull is in progress

- When a pull completes, new trades appear on the open dashboard automatically — no page refresh, no polling loop, no cronjob/scheduler

Deliverables

- One Git repo with README (setup instructions)
- Short architecture note (diagram + why this design)
- Video walkthrough

Submission

Submit to: chirag.g@arhamfintech.ai

CC: HR Team (hr@arhamfintech.ai)

Timeline: within 2 days

Location: Internship is on-site at the Malad office, 10am–7pm
